## Math 116 — Practice for Exam 1

Generated September 16, 2020

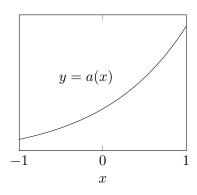

NAME: SOLUTIONS	
Instructor:	Section Number:

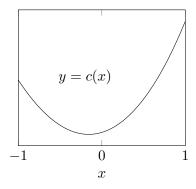

- 1. This exam has 2 questions. Note that the problems are not of equal difficulty, so you may want to skip over and return to a problem on which you are stuck.
- 2. Do not separate the pages of the exam. If any pages do become separated, write your name on them and point them out to your instructor when you hand in the exam.
- 3. Please read the instructions for each individual exercise carefully. One of the skills being tested on this exam is your ability to interpret questions, so instructors will not answer questions about exam problems during the exam.
- 4. Show an appropriate amount of work (including appropriate explanation) for each exercise so that the graders can see not only the answer but also how you obtained it. Include units in your answers where appropriate.
- 5. You may use any calculator except a TI-92 (or other calculator with a full alphanumeric keypad). However, you must show work for any calculation which we have learned how to do in this course. You are also allowed two sides of a  $3'' \times 5''$  note card.
- 6. If you use graphs or tables to obtain an answer, be certain to include an explanation and sketch of the graph, and to write out the entries of the table that you use.
- 7. You must use the methods learned in this course to solve all problems.

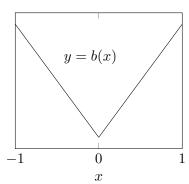

Semester	Exam	Problem	Name	Points	Score
Winter 2019	1	9		6	
Winter 2018	1	8		14	
Total				20	

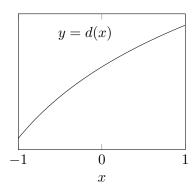

Recommended time (based on points): 18 minutes

**9.** [6 points] Below are the graphs of four functions. Note that the vertical scales are not given and may not be the same.

We have calculated LEFT(6), RIGHT(6), TRAP(6), AND MID(6) for the definite integral of each of three of these functions on the interval [-1, 1]. These estimates are listed below. For each one, circle the corresponding function.

(i) 
$$\begin{array}{|c|c|c|} \hline LEFT(6) & 1.21875 \\ \hline RIGHT(6) & 1.58496 \\ \hline MID(6) & 1.40185 \\ \hline TRAP(6) & 1.29890 \\ \hline \end{array}$$

Function: 
$$a(x) c(x)$$

$$b(x) d(x)$$

(ii) 
$$\begin{array}{c|c} LEFT(6) & 5.1552 \\ \hline RIGHT(6) & 8.0374 \\ \hline MID(6) & 5.0882 \\ \hline TRAP(6) & 6.5963 \\ \end{array}$$

Function: 
$$a(x) \quad \boxed{c(x)}$$

$$b(x) \quad d(x)$$

8. [14 points] Let g(x) be a differentiable function with domain (-1, 10) where some values of g(x) and g'(x) are given in the table below. Assume that all local extrema and critical points of g(x) occur at points given in the table.

								7	
g(x)	2.0	3.3	5.7	6.8	6.0	4.3	2.4	0.2	-4.9
g'(x)	2.8	2.5	2.0	0.0	-1.4	-1.9	-1.6	-3.0	-8.1

a. [3 points] Estimate  $\int_0^8 g(x) dx$  using RIGHT(4). Write out each term in your sum.

Solution: With 4 rectangles the width of each is  $\Delta x = \frac{8-0}{4} = 2$ . Then

RIGHT(4) = 
$$g(2)\Delta x + g(4)\Delta x + g(6)\Delta x + g(8)\Delta x$$
  
=  $(5.7 + 6.0 + 2.4 - 4.9) \cdot 2$   
=  $18.4$ 

Answer: 18.4

**b.** [4 points] Approximate the area of the region between g(x) and the function f(x) = x + 2 for  $0 \le x \le 4$ , using MID(n) to estimate any integrals you use. Use the greatest number of subintervals possible, and write out each term in your sums.

Solution: The function g(x) is concave down on [0,4], so g(x) is greater than or equal to the linear function f(x) on this interval. The integral to compute this area is

$$\int_0^4 g(x) - f(x) \, dx = \int_0^4 g(x) \, dx - \int_0^4 x + 2 \, dx.$$

Since f(x) is linear, we get the same answer whether we use MID to approximate  $\int_0^4 g(x) - f(x) dx$  or just  $\int_0^4 g(x) dx$  and compute  $\int_0^4 f(x) dx$  exactly. In either case, we can use at most 2 subintervals and  $\Delta x = 2$ .

If we compute MID(2) for  $\int_0^4 g(x) - f(x) dx$ , we get

$$MID(2) = (g(1) - f(1))\Delta x + (g(3) - f(3))\Delta x$$
$$= ((3.3 - 3) + (6.8 - 5))2$$
$$= (.3 + 1.8)2$$
$$= 4.2.$$

If we compute  $\int_0^4 f(x) dx = 16$  and then compute MID(2) for  $\int_0^4 g(x) dx$  we get

$$MID(2) = g(1)\Delta x + g(3)\Delta x$$
  
=  $(3.3 + 6.8)2$   
=  $20.2$ .

Then we get 20.2 - 16 = 4.2 for the total area.

Answer: \_\_\_\_\_\_4.2

c. [3 points] Is your answer to b. an overestimate, an underestimate, or is there not enough information to tell? Briefly justify your answer.

Solution: Since we are only given a table and not told that the concavity does not change between points, we technically **do not have enough information** to answer this question.

Had it been the case that g'(x) has no critical points aside from those in the table, it would follow that g(x) is concave down, because g'(x) would be decreasing on the given interval. Since f(x) is linear, the concavity of g(x) - f(x) would also be concave down. In that case, MID(2) would be an **overestimate**.

Credit was awarded for both of these answers.

d. [4 points] Write an integral giving the arc length of y = g(x) between x = 2 and x = 8. Estimate this integral using TRAP(2). Write out each term in your sum.

Solution: The arc length is given by the integral

Arc length = 
$$\int_{2}^{8} \sqrt{1 + g'(x)^2} dx.$$

The width of our trapezoids is  $\Delta x = \frac{8-2}{2} = 3$ .

If we compute the areas of the trapezoids directly we get

$$\begin{aligned} \text{TRAP}(2) &= \left(\frac{\sqrt{1 + g'(2)^2} + \sqrt{1 + g'(5)^2}}{2}\right) \Delta x + \left(\frac{\sqrt{1 + g'(5)^2} + \sqrt{1 + g'(8)^2}}{2}\right) \Delta x \\ &\approx (2.1915795 + 5.1542930)3 \\ &\approx 22.0376175. \end{aligned}$$

If we compute LEFT(2) and RIGHT(2) first and then take an average we get

LEFT(2) = 
$$\sqrt{1 + g'(2)^2} \Delta x + \sqrt{1 + g'(5)^2} \Delta x$$
  
 $\approx (4.3831590)3$   
 $\approx 13.1494770.$ 

RIGHT(2) = 
$$\sqrt{1 + g'(5)^2} \Delta x + \sqrt{1 + g'(8)^2} \Delta x$$
  
 $\approx (10.3085860)3$   
 $\approx 30.9257580.$ 

Then

$$TRAP(2) = \frac{1}{2}(LEFT(2) + RIGHT(2)) \approx 22.0376175.$$

**Answer:** 
$$TRAP(2) =$$
 **22.0376175**
